## COMPUTER SCIENCE IS...

## SOLVING PROBLEMS THROUGH ALGORITHMS, ENCODED AS PROGRAMS

- Problem analysis
- Mathematical modeling
- Thinking an algorithm
- Implementing it in a programming language
- Verifying correcteness and efficiency of the program

## THINKING AN ALGORITHM

## A SEQUENCE OF SIMPLE STEPS WHICH SOLVE THE PROBLEM IN GENERAL

## How many ' $i$ ' occur in this text?

When Mr. Bilbo Baggins of Bag End announced that he would shortly be celebrating his eleventy-first birthday with a party of special magnificence, there was much talk and excitement in Hobbiton. Bilbo was very rich and very peculiar, and had been the wonder of the Shire for sixty years, ever since his remarkable disappearance and unexpected return. The riches he had brought back from his travels had now become a local legend, and it was popularly believed, whatever the old folk might say, that the Hill at Bag End was full of tunnels stuffed with treasure. And if that was not enough for fame, there was also his prolonged vigour to marvel at. Time wore on, but it seemed to have little effect on Mr. Baggins. At ninety he was much the same as at fifty. At ninety-nine they began to call him _well_-preserved, but _unchanged_ would have been nearer the mark. There were some that shook their heads and thought this was too much of a good thing; it seemed unfair that anyone should possess (apparently) perpetual youth as well as (reputedly) inexhaustible wealth. 'It will have to be paid for,' they said. 'It isn't natural, and trouble will come of it!' But so far trouble had not come; and as Mr. Baggins was generous with his money, most people were willing to forgive him his oddities and his good fortune. He remained on visiting terms with his relatives (except, of course, the Sackville-Bagginses), and he had many devoted admirers among the hobbits of poor and unimportant families. But he had no close friends, until some of his younger cousins began to grow up. The eldest of these, and Bilbo's favourite, was young Frodo Baggins. When Bilbo was ninety-nine, he adopted Frodo as his heir, and brought him to live at Bag End; and the hopes of the Sackville-Bagginses were finally dashed. Bilbo and Frodo happened to have the same birthday, September 22nd. 'You had better come and live here, Frodo my lad,' said Bilbo one day; 'and then we can celebrate our birthday-parties comfortably together.' At that time Frodo was still in his _tweens,_ as the hobbits called the irresponsible twenties between childhood and coming of age at thirty-three.

## A DEFINITION OF"I"

- We need a definition of character "i" that allows people to recognize it
- It shows up in a single way: as i
- This holds, at least, if text is given as sequence of alphabetic characters

## A DIFFERENT DEFINITION OF "I"

- If text is stored in/for a computer it is encoded as a sequence of bits (0 or I)
- According to the ASCII encoding scheme, each character is encoded by the 7 bits and " $i$ " corresponds to the sequence IIOIOOI
- The text in ASCII
IOOIIIOIIOOIOIIIOIIOOIIOIIOOIOOIIIIIOIIIIIIIOOIOIIOOOOIIOOOOOIIOOIOOIIOIOOIIOOOOOIIIOIOIIIOI
IIOIO0000IIIOIOOIIIOOIOIIO000IIIOIIOIIIOIIIIIIOIIIOIIIOIOOIIOIIIIIOOOOOIIIOOOOIIIOOIOIIOIOOI

## SOMETIMES IT'S NOT SO EASY...

How many times does Emma Stone appear below?

## JUST IN CASE YOU DON'T KNOW HER...

## EMMA STONE

- Blonde?
- Green eyes?
- Freckles?

## BUT, HOW CAN WE "DEFINE" EMMA STONE?

By examples

## BUT, HOW CAN WE "DEFINE" EMMA STONE?

By negative examples

## INDUCTION

- We are not able to "explain" how to recognize Emma Stone, and to code it in an algorithm
- We can only show (many) examples of Emma Stone (and of "not Emma Stone")
- We need an algorithm that, from such examples, "learns" how to recognize Emma Stone, in such a way that...

YES

Emma Stone?

RECOGNIZING DIGITS

$$
\begin{array}{llllllllll}
5 & 0 & 4 & 1 & 9 & 2 & 1 & 3 & 1 & 4 \\
3 & 5 & 3 & 6 & 1 & 7 & 2 & 8 & 6 & 9 \\
4 & 0 & 9 & 1 & 1 & 2 & 4 & 3 & 2 & 7 \\
3 & 8 & 6 & 9 & 0 & 5 & 6 & 0 & 7 & 6 \\
1 & 8 & 7 & 9 & 3 & 9 & 8 & 5 & 9 & 3 \\
3 & 0 & 7 & 4 & 9 & 8 & 0 & 9 & 4 & 1
\end{array}
$$

| RECOGNIZING DIGITS |  |  |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 5 | 0 | 4 | 1 | 9 | 2 | 1 | 3 | 1 | 4 |
| 3 | 5 | 3 | 6 | 1 | 7 | 2 | 1 | 1 | 9 |
| 3 | 5 | 3 | 6 | 1 | 2 | 8 | 9 |  |  |
| 4 | 0 | 9 | 1 | 1 | 2 | 4 | 3 | 2 | 1 |
| 3 | 8 | 6 | 1 | 1 | 1 | 1 | 1 | 4 |  |
| 3 | 8 | 6 | 9 | 0 | 5 | 6 | 0 | 7 | 6 |
| 1 | 8 | 7 | 9 | 3 | 9 | 8 | 5 | 9 | 3 |
| 3 | 0 | 7 | 4 | 9 | 8 | 0 | 9 | 4 | 1 |

## HOW TO DEAL WITH THE PROBLEM?

- Build a "model" of 0 , of $I$, of $2, \ldots$, of 9 from their images
- An image: $28 \times 28$ dots (pixel): each an integer value ranging from 0 (white) to 255 (black)
- an image: sequence of $28 \times 28=784$ values $x_{1}, x_{2}, x_{3}, \ldots, x_{784}$ each in $\{0, I, \ldots, 255\}$
- What do we want? A function from $\{0, \mathrm{I}, \ldots, 255\}^{784}$ to $\{0,1,2,3,4,5,6,7,8,9\}$ making as few mistakes as possible

## HOW TO DEAL WITH THE PROBLEM?

- How to do? For example We want to get 10 functions $f_{0}, f_{1}, \ldots, f_{9}$ from $\{0, \mathrm{I}, \ldots, 255\}^{784}$ to $[0, \mathrm{I}]$ with the additional property that, for any image, the sum of their values is I. then, we can see them as probabilities
- For any image $x=[0,3,78,167, \ldots, 35,2]$ ( 784 values) we see $f_{0}(x)$ as the probability that it is the image of a $0, f_{l}(x)$ as the probability that it is the image of a $I$, and so on
- We choose the interpretation corresponding to the function providing the highest value

## NOT ALL POSSIBLE FUNCTIONS...

- We do not search among all possible functions; only among the ones with some predefined "structure". for example:
- all 784 values are combined by summing them (each multiplied with a suitable "weight") $\rightarrow$ result $=$ a single numeric value
- The resulting value is transformed to a value in $[0,1]$

## THE BEST POSSIBLE FUNCTION...

- Each of the functions to consider is characterized by the values of the 784 "weights"
- The method, applied to examples, results in a certain number of errors, when applied to available images
- We look for functions with a minimum number of errors $\rightarrow$ we look for the weight values which result in a function with the minimum number of errors
